

آموزش استفاده از نرم افزار رفرنس نویسی EndNote

بهناز جعفری

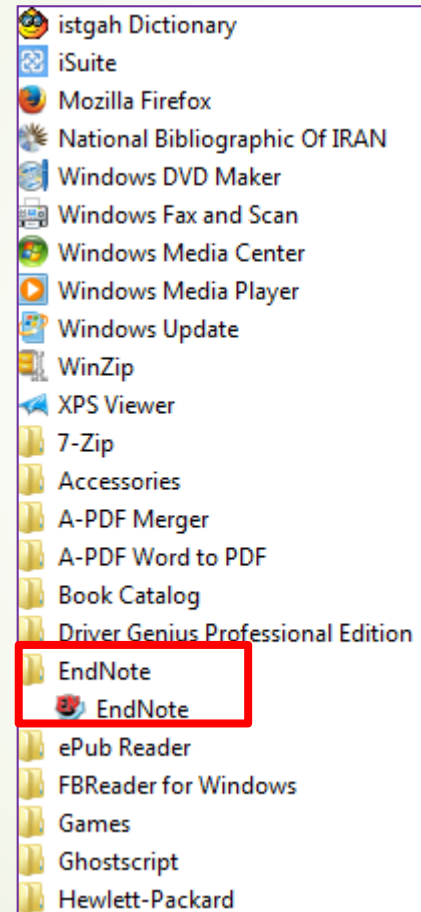

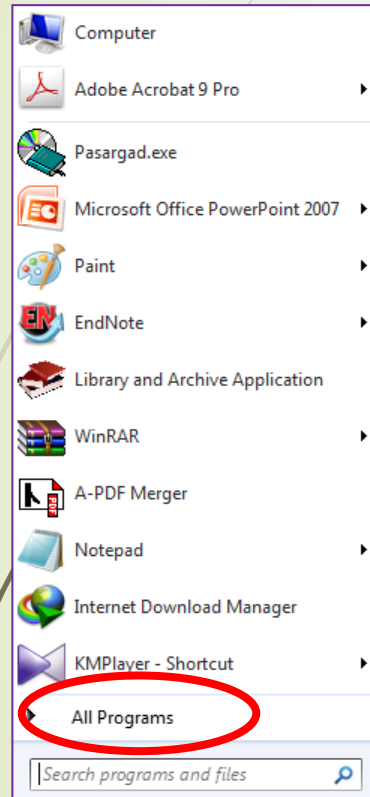

کارشناس ارشد علم سنجی

دانشگاه علوم پزشکی شهید بهشتی

معرفی نرم افزار

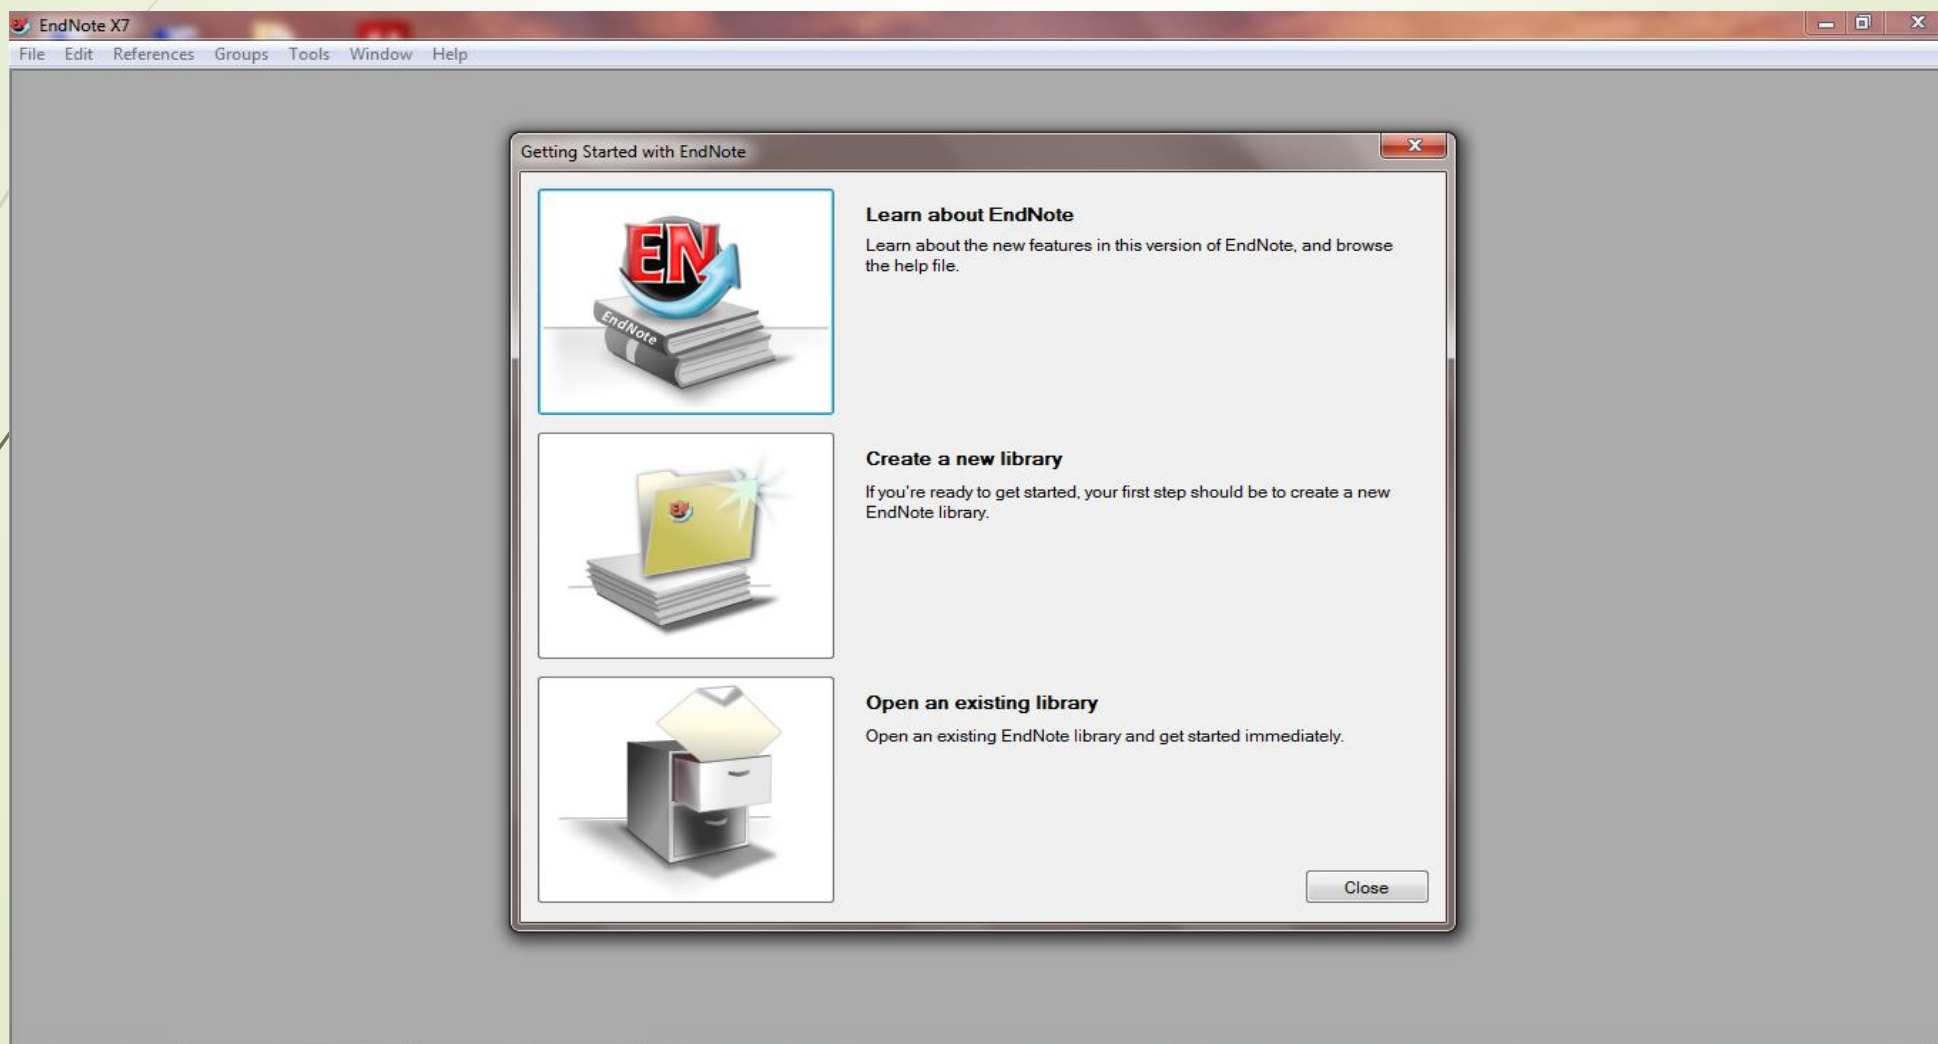

- ایجاد یک کتابخانه مجازی برای ذخیره و نگهداری مراجع
- برقراری اتصال مستقیم به بسیاری از بانکها و پایگاههای اطلاعاتی
- انجام بهترین طبقه‌بندی برای دسترسی به منابع و مطالعه آنها
- ذخیره و سازماندهی جداول، تصاویر در کتابخانه مجازی
- وارد نمود اطلاعات منابع تنها از طریق وارد کردن فایل PDF مقالات
- تغییر فرمت منابع مقاله بر اساس مجلات مختلف با یک کلیک
- وارد کردن منبع به متن پروپوزال تحقیقاتی، پایان نامه، مقاله و کتاب و همچنین اضافه شدن خودکار آن به فهرست منابع در انتهای فصل یا انتهای سند با یک کلیک

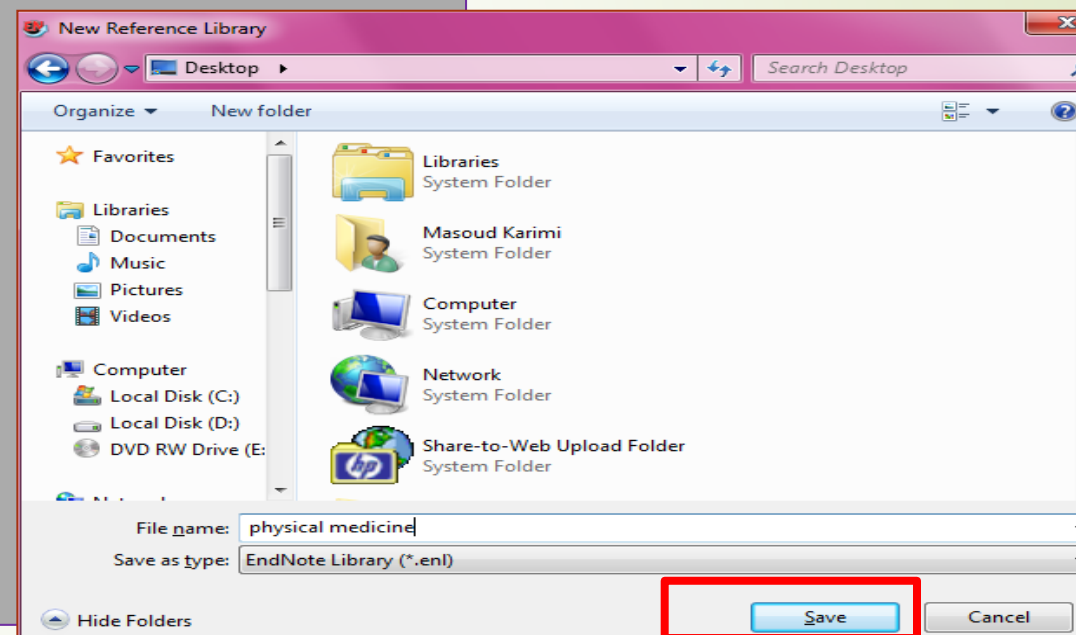

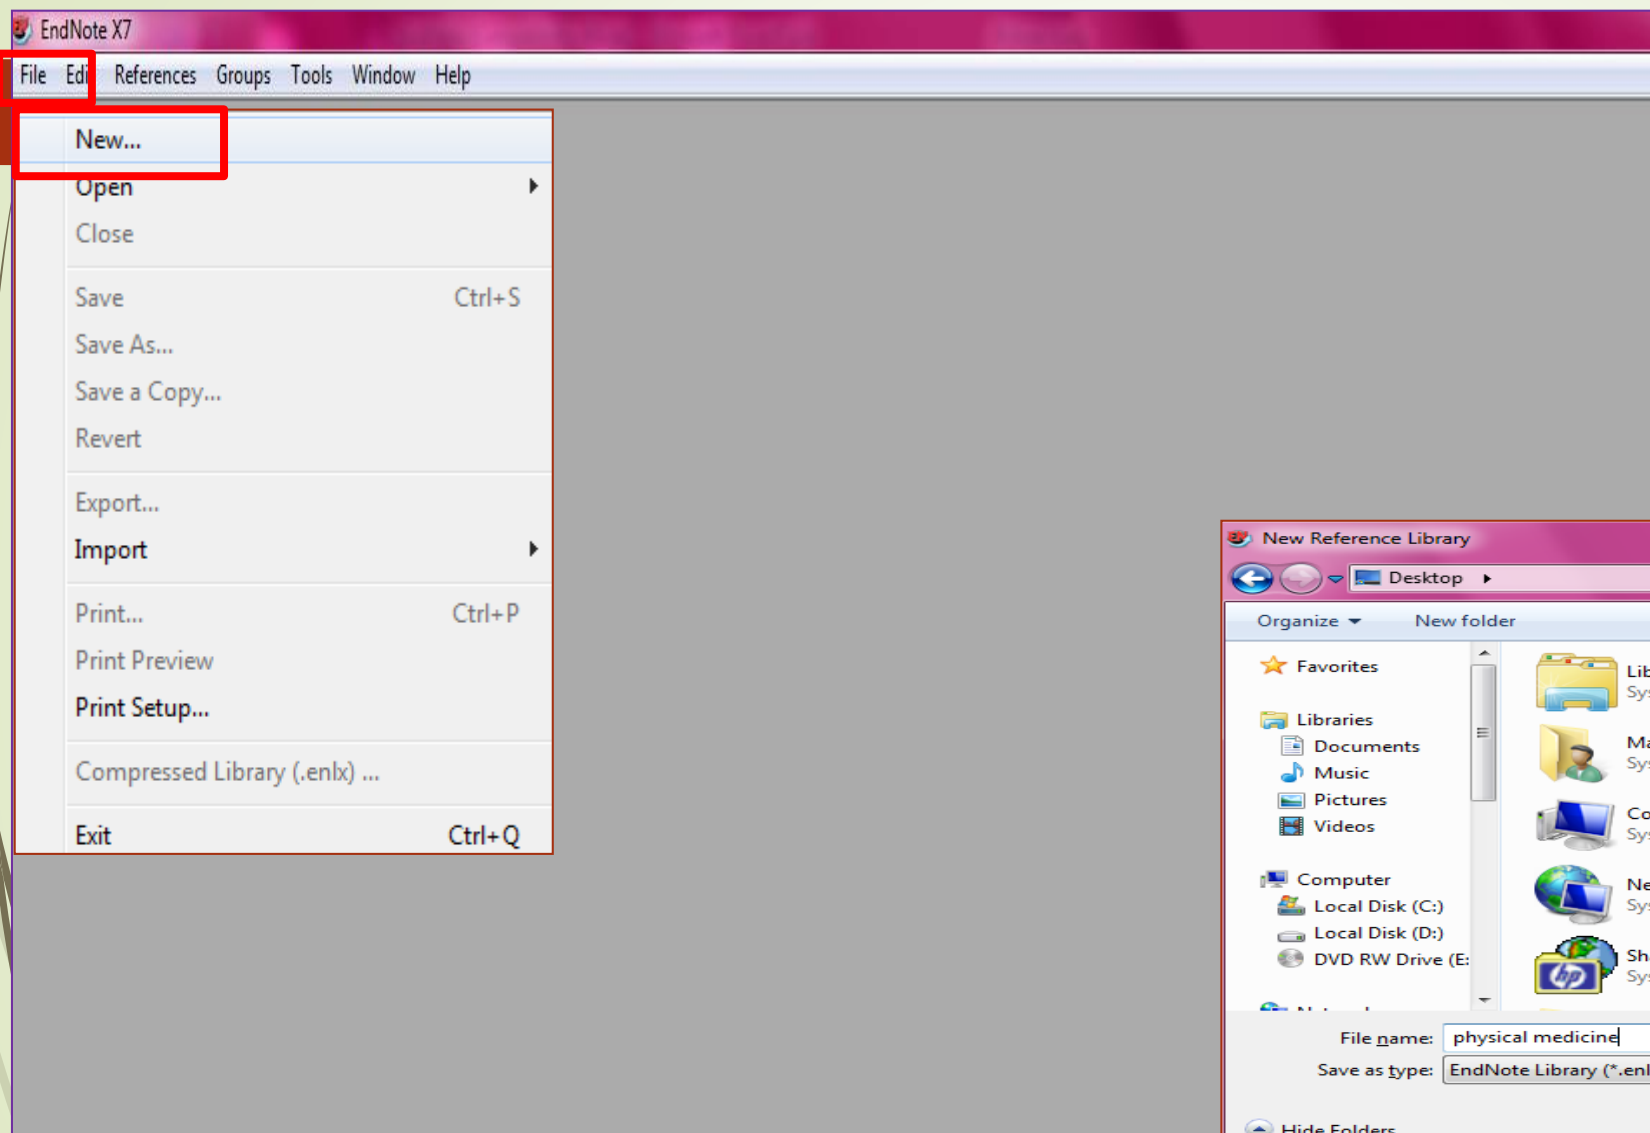

شروع کار با EndNote

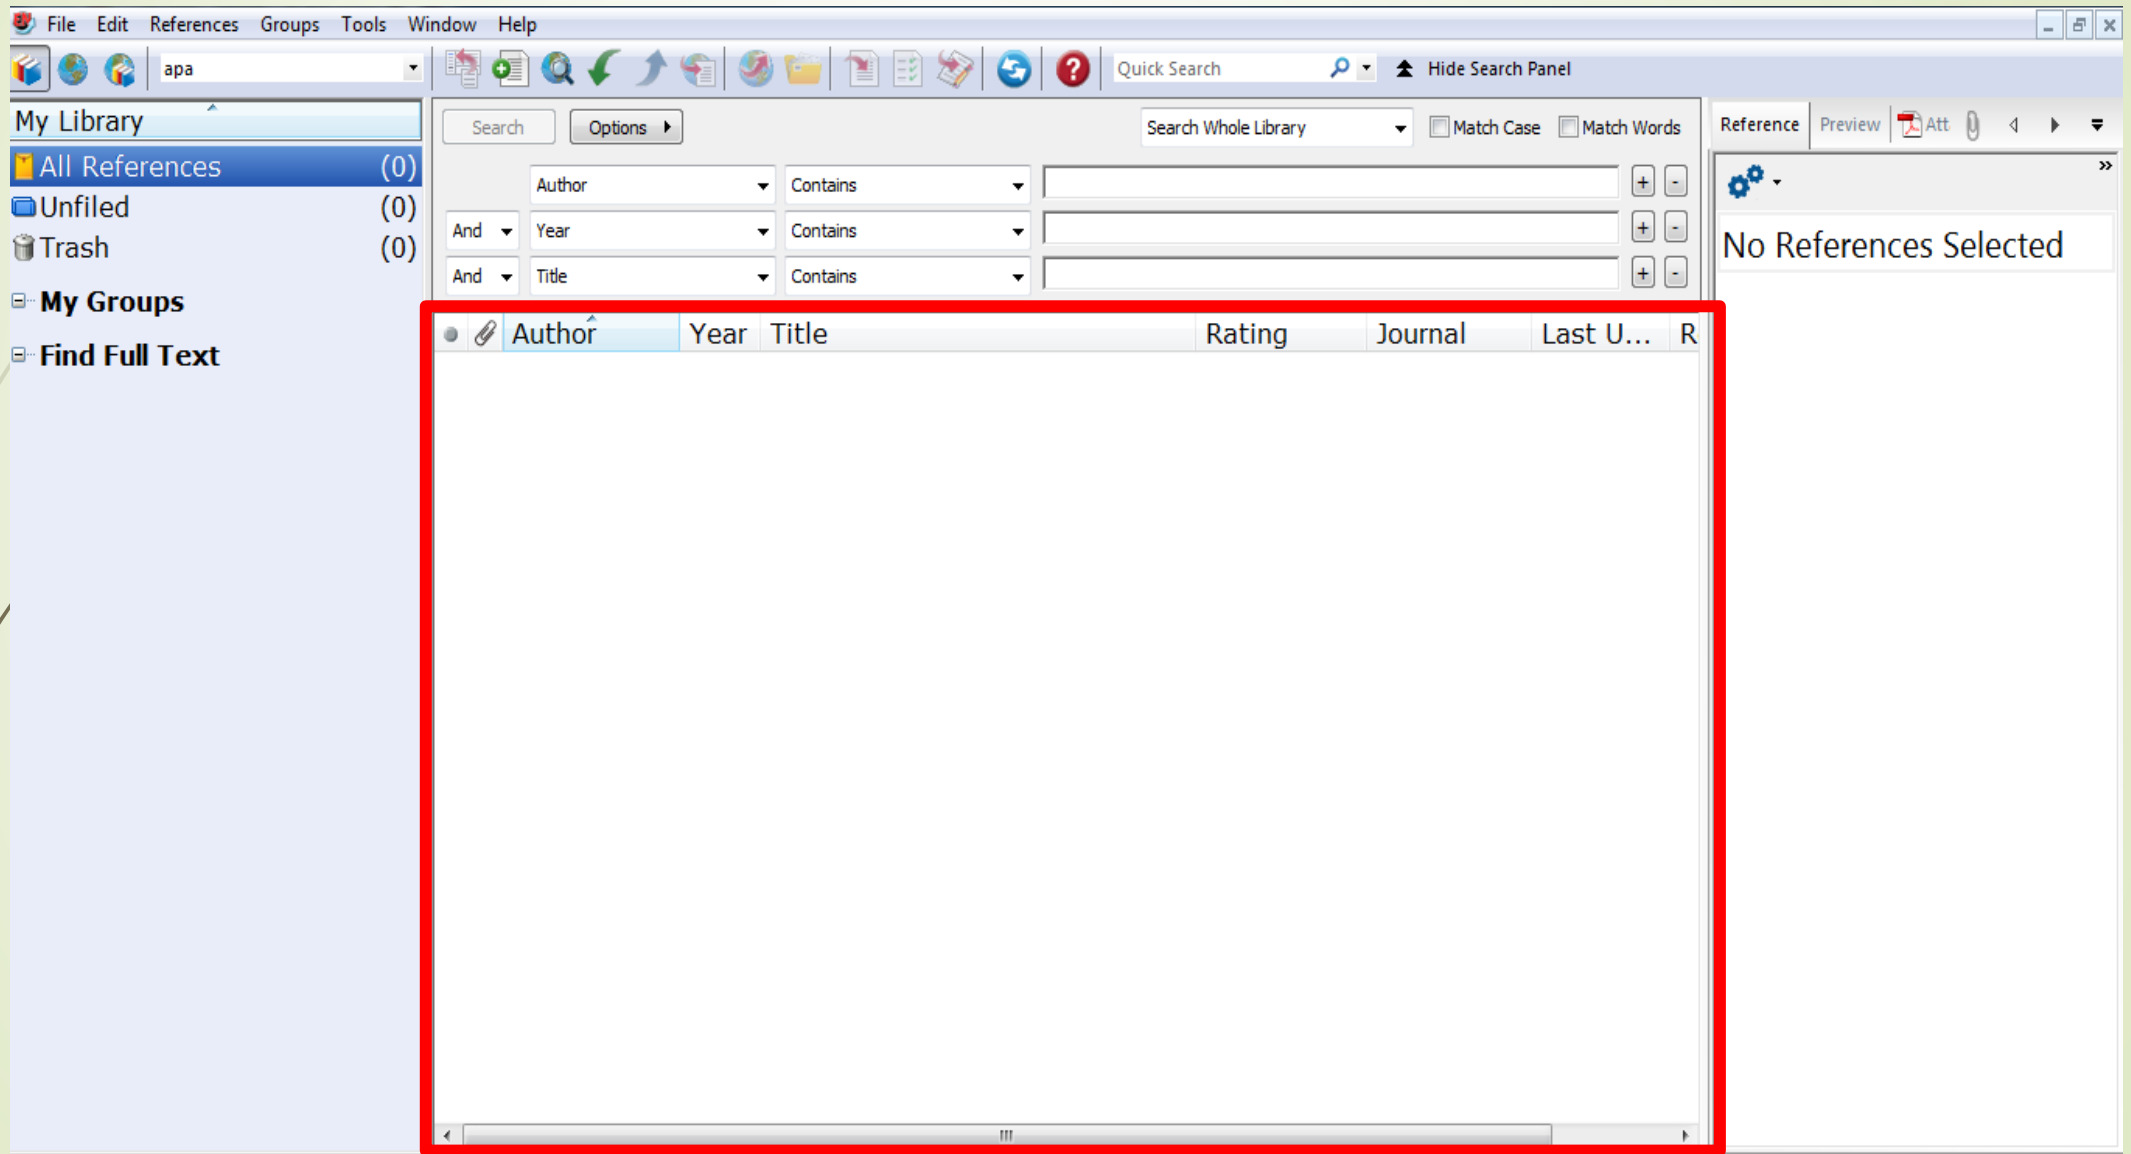

**Start menu, choose all Programs >
EndNote >EndNote Program**

اگر اولین بار است که از این برنامه استفاده می کنید، صفحه ای به این شکل برای شما باز می شود. شما می توانید از طریق این صفحه به ایجاد یک کتابخانه جدید پرداخته و یا کتابخانه ای را که قبلاً تعریف کرده اید باز کنید.

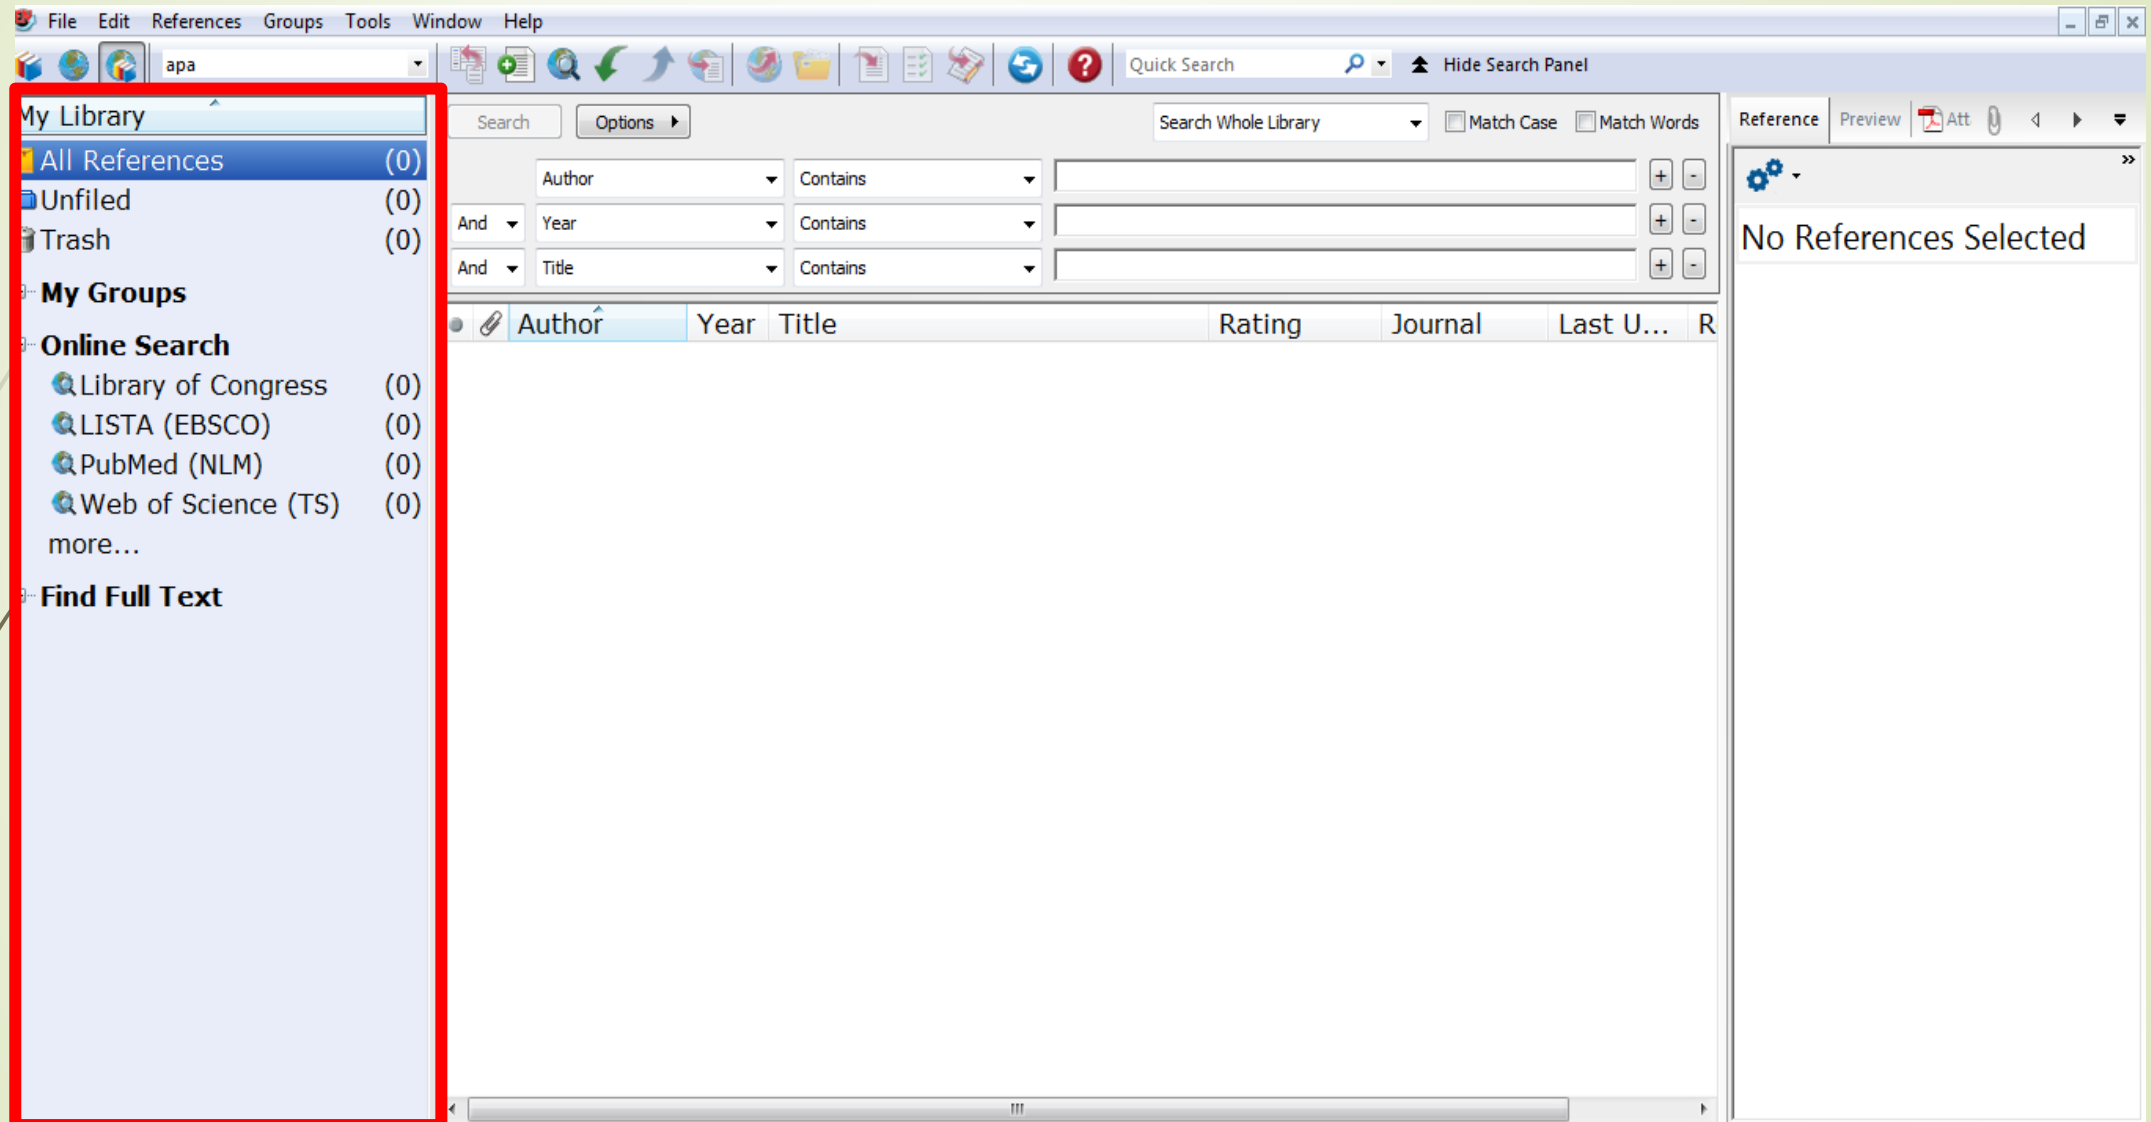

1. Reference list panel

2.Group panel

3. Search panel

The screenshot shows the EndNote X7 interface with the search panel active. The left sidebar contains the 'My Library' section with folders for 'All References (59)', 'Unfiled (0)', 'Trash (0)', 'Avian Intelligence' (subfolders: Avian Cognition (31), Corvids (19), Corvids & Parrots (6), Parrots (24)), 'Bats' (subfolders: Chiroptera (22), Echolocation (6), Echolocation OR Sonar (7), Sonar (5)), 'My Groups' (Cognition-All (33)), and 'Find Full Text'. The central search panel is highlighted with a red border and contains a search bar, a dropdown menu for 'Search Whole Library', and checkboxes for 'Match Case' and 'Match Words'. Below these are five search criteria rows, each with a dropdown for the field, a dropdown for the search type, and a text input field. The search results table below the search panel lists 59 references with columns for Author, Year, Title, Rating, Journal, and Last U. The right sidebar shows the details for the selected reference, including the Reference Type (Book Section), Rating, Author (Clayton, N. S., Emery, N. J.), Year (2009), Title (What do jays know about other minds and other times?), Editor (Berthoz, A., Christen, Y.), Book Title (Neurobiology of Umwelt: How Living Beings Perceive the World), Place Published (Berlin), Publisher (Springer-Verlag Berlin), Volume, Number of Volumes, Series Volume, Pages (109-123), Chapter, and Series Editor.

Guillain-Barré syndrome
Serial

The effect of timing is crucial on the electrophysiology of Guillain-Barré syndrome (GBS). On this topic however depend the usefulness of systematic serial studies performed at specific time intervals. We retrospectively analysed records of 138 consecutive patients with GBS from Birmingham, UK, (2001–2012), studied between 0–14 days (n = 15–42 days post-onset using new criteria which we recently proposed (4). Rates of acute inflammatory demyelinating polyneuropathy (AIDP) (n = 84/5), axonal GBS (n = 5/2) and non-specific forms (n = 49/5) were similar for both groups. Similarly, no significant differences between timings were observed using Friedman's χ^2 criteria. Proportions were comparable to published serial studies for both groups, for AIDP (p = 0.22, p = 0.13) and axonal GBS (p = 0.73, p = 0.76) but were higher than with serial studies for non-specific forms in patients studied on days 0–14 (p = 0.012), although not in those studied on days 15–42 (p = 0.17). This suggests that over the initial 6 weeks post-onset, timing fails to influence subgroup proportions in a large GBS cohort, irrespective of criteria used. Beyond studies agree themselves unlikely to be helpful when systematically performed within this time frame, except in exceptional cases. The benefits of repeat studies remain possible at other times but may need to be individualised, and require future prospective evaluation.

1. Introduction

The effect of timing on electrophysiology of Guillain-Barré syndrome (GBS) has been the object of several studies in recent years [1,2]. These have consistently demonstrated a change in proportion of GBS subtypes with a described partial shift from acute inflammatory demyelinating polyneuropathy (AIDP) to axonal GBS. The benefit of serial studies has as a result been suggested and considered the gold standard for diagnosis of GBS subtypes. However, serial studies have been performed between 7 and 70 days post-onset rather than at specific time points [3] making the important issue of most appropriate timing of repeat electrophysiology. Serial studies were in addition interpreted using criteria for GBS of poor specificity for demyelination and low sensitivity to identify axonal forms [3]. We have since recently proposed new electrophysiological criteria for Guillain-Barré syndrome (GBS) subtypes [4]. These were based on serial demyelinating cut-offs [5], whose reliability have since been confirmed in multiple populations with chronic inflammatory demyelinating polyneuropathy (CIDP) [6,7]. We in addition utilised new data on axonal GBS subtypes to add parameters in order to increase the detection of this subcategory of patients. With these new proposed criteria [4], proportions of acute inflammatory demyelinating polyneuropathy (AIDP), axonal GBS and non-specific forms were similar to those obtained by other investigators with most informative serial, although non-homogeneously timed studies, using previous criteria [1,2].

The timing of nerve conduction may directly impact on the proportions of subtypes in a GBS cohort, as shown by the previously published serial studies [1,2]. Late electrophysiological results are analysed as found at a previous moment, irrespective of earlier findings. As a result, global findings at different timings in a large cohort of GBS patients may therefore be helpful in evaluating the potential benefits of serial studies. We here tried to determine the effects of timing on proportions of GBS subtypes in different patients having undergone "early" (0–14 days post-onset onset) or "delayed" (15–42 days post-onset onset) studies. In an attempt to ascertain the eventual benefits of serial studies within this time frame.

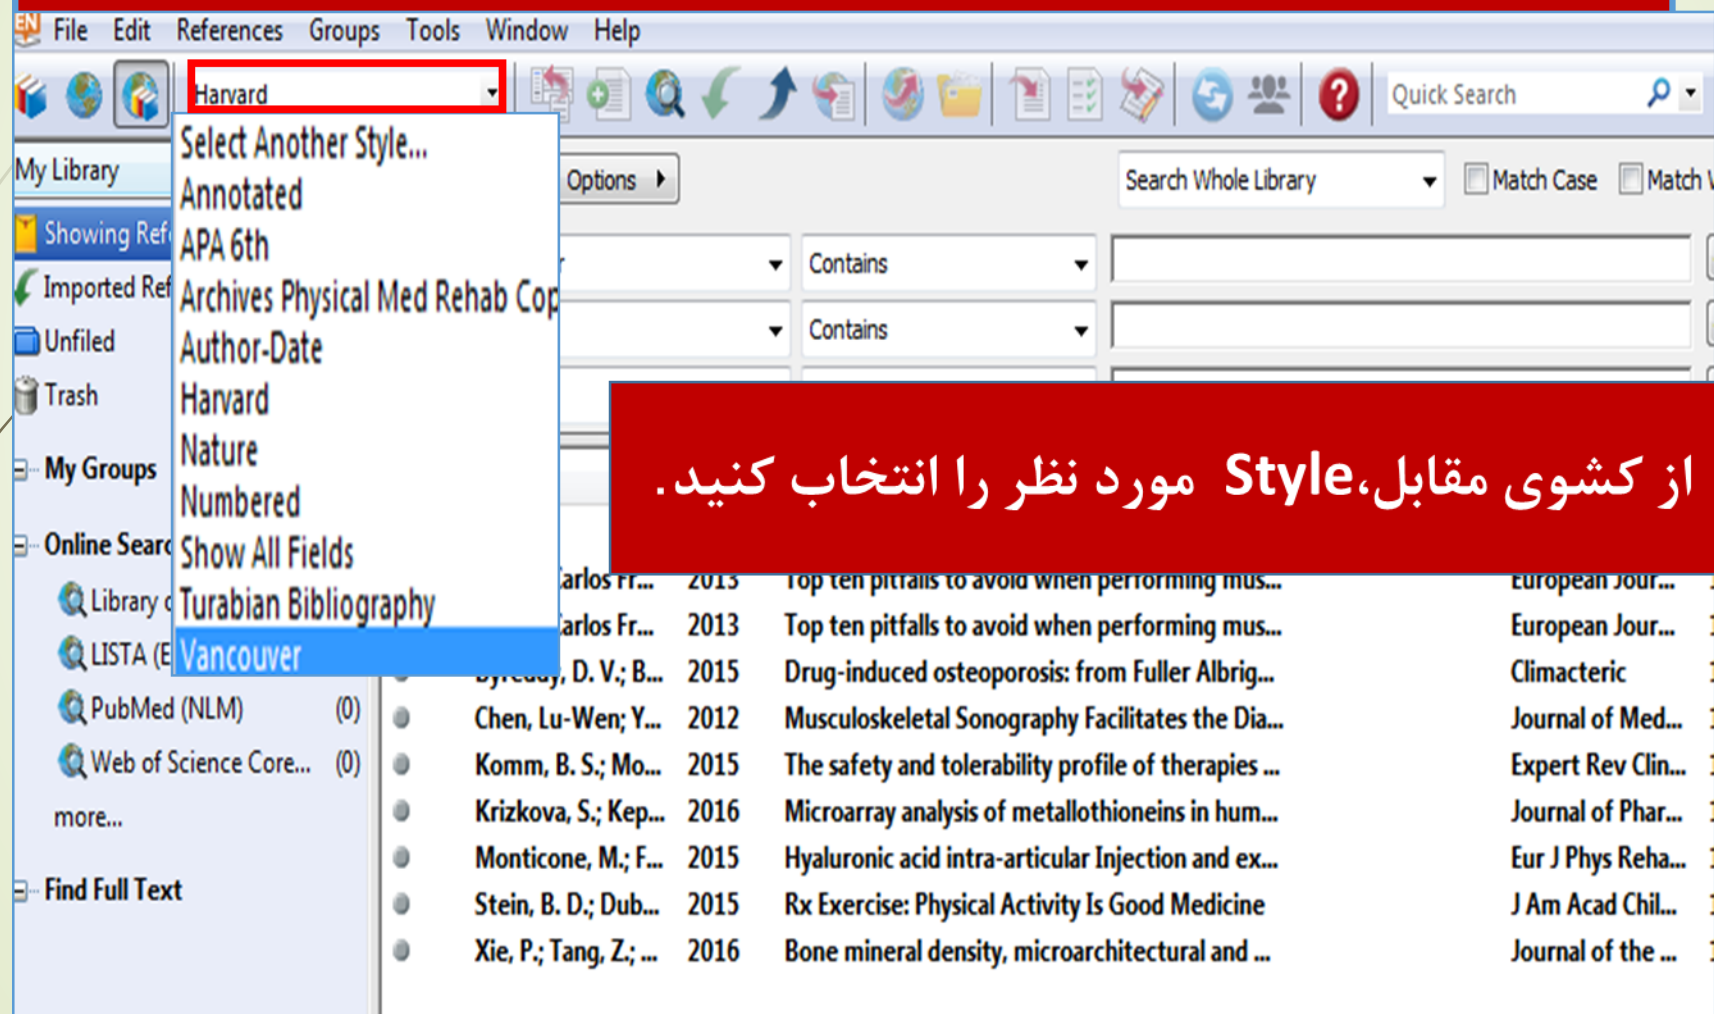

2. Methods

We retrospectively reviewed our institutional database of patients admitted with a diagnosis of GBS between 2001 and 2012 at the Queen Elizabeth Hospital, Birmingham. The diagnosis was made in each case in accordance with established clinical criteria [8]. Patients included had undergone electrophysiological testing at our centre, of at least 2 motor and 2 sensory nerves within 6 weeks of symptom onset. Electrophysiology was performed according to standard methods by a qualified senior physician trained and experienced in electrophysiology.

Conclusions

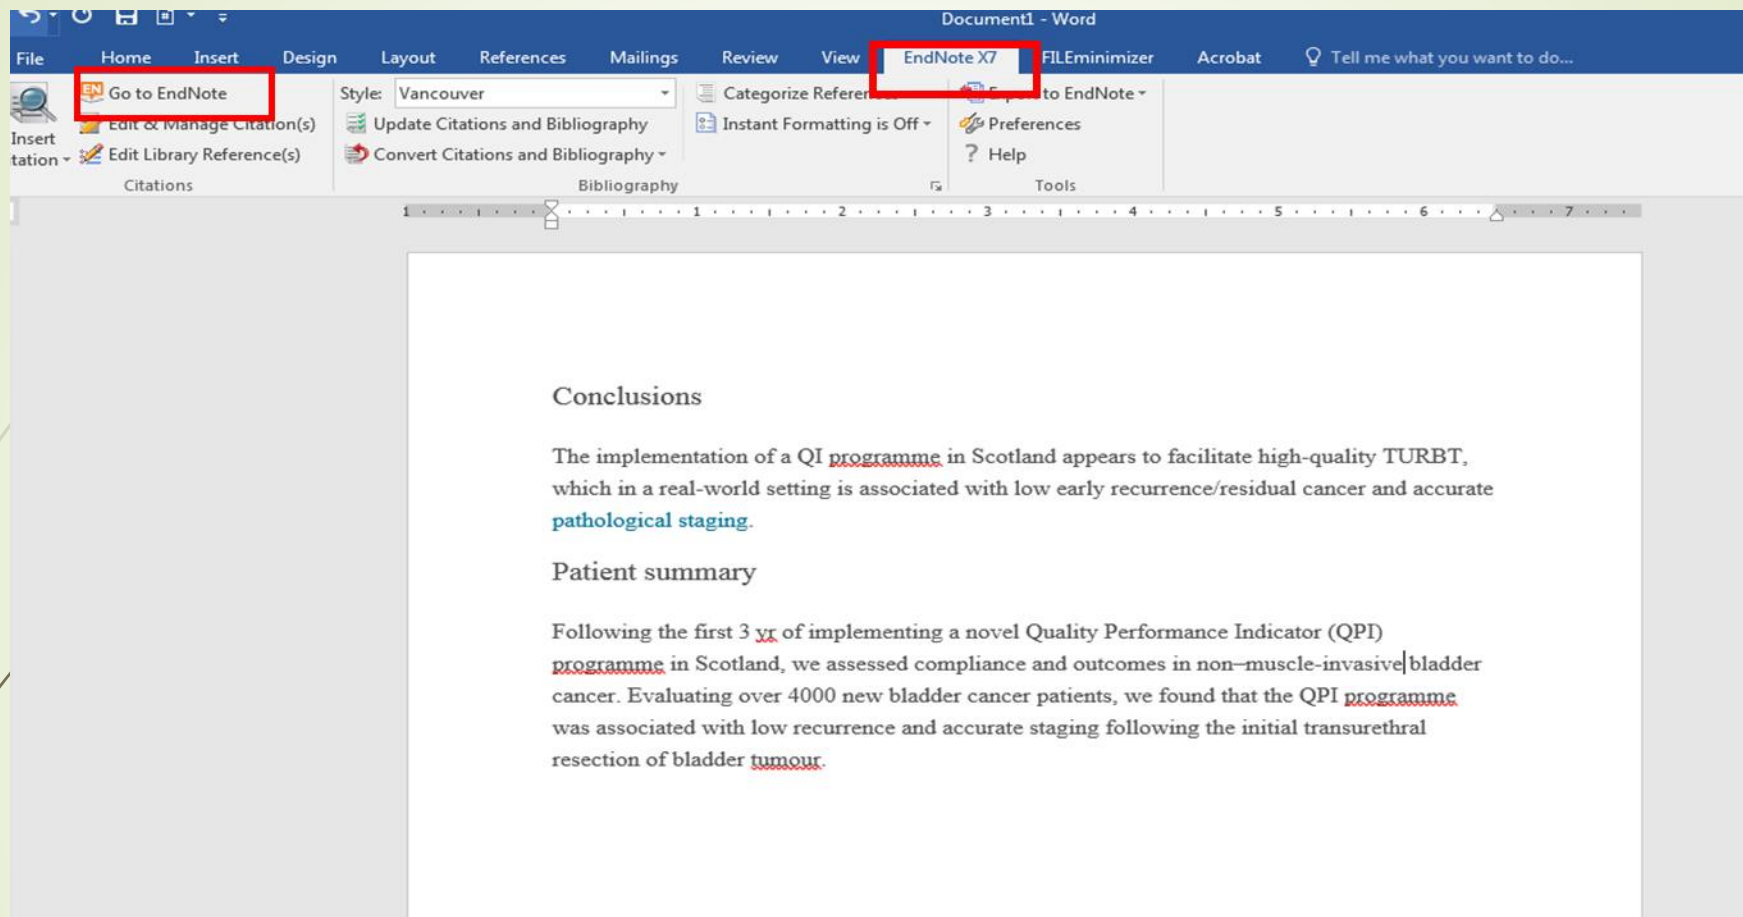

The implementation of a QI programme in Scotland appears to facilitate high-quality TURBT, which in a real-world setting is associated with low early recurrence/residual cancer and accurate pathological staging.

Patient summary

Following the first 3 yr of implementing a novel Quality Performance Indicator (QPI) programme in Scotland, we assessed compliance and outcomes in non-muscle-invasive bladder cancer. Evaluating over 4000 new bladder cancer patients, we found that the QPI programme was associated with low recurrence and accurate staging following the initial transurethral resection of bladder tumour.
